

Brazos River Modeling Workshop

FORT BEND COUNTY-WIDE DRAINAGE STUDY

Héctor Olmos P.E., CFM
Vice President
Freese and Nichols Inc.

July 24th, 2020

Sam Hinojosa P.E, CFM
Vice President
Halff Associates Inc.

Agenda

- Participation Guidelines
- Background
- Project Objectives
- Hydrologic Analysis
- Hydraulic Analysis
- Preliminary Results
- Next Steps

Participation Guidelines

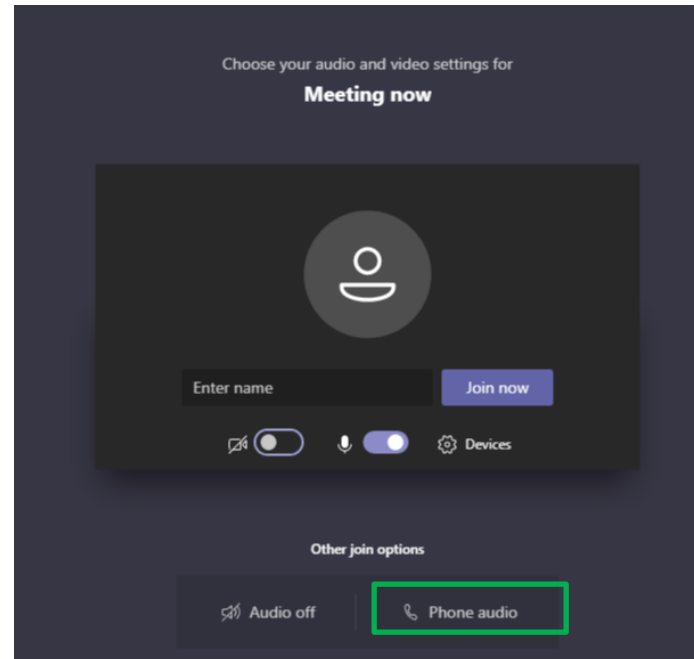

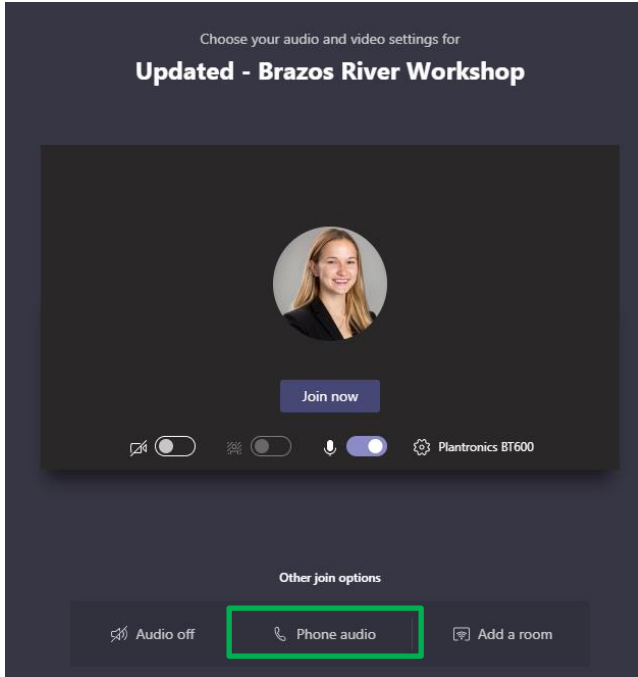

Please utilize the chat function for general questions and comments (circled in red)

If you are not using your computer audio and wish to speak during the presentation

- Please join the meeting from your computer **FIRST** using the link provided
- Select “phone audio” to dial out to another audio device (circled in green)
- In the meeting, use the “raise hand” feature to request to be unmuted (circled in blue)

Background

Fort Bend – Countywide Watershed Study

- Brazos River Erosion Analysis
- Barker Reservoir Engagement
- FBCDCM Updates
- Master Drainage Plan Updates to Local Watersheds
- Brazos River Modeling Update

Previous FBC Brazos River Studies

- 1987 – Fort Bend County Enters NFIP
- 2014 FEMA Study
 - 2005 LiDAR & River Cross-Sections
 - Flood Frequency Analysis (164,000 cfs at Richmond)
 - HEC-RAS 1D Model
 - LIDs Respond / FEMA Certification
 - Effective April 2, 2014

Significant Changes

- 5 Major Flood Events
- 2014 LiDAR & 2019 Bathymetry
- 2016 – HEC-RAS 2D Modeling Released
- 2018 – Atlas 14 Released
- Various New Studies
 - BRA/Halff
 - RAMPP
 - USACE-FRM

Stated Study Goal

“Develop new hydrologic and hydraulic models that can be used to better understand how the Brazos River behaves during flood events and can be used in decision making during future floods.”

Study Leads:

- Héctor Olmos, Freese & Nichols Inc.
- Sam Hinojosa, Halff Associates Inc.

Hydrology

Brazos River – Study History

- Previous Studies along the Lower Brazos River
 - 1984 EHA Study
 - 2006 LJA Study
 - 2009 TSDN
 - 2015 RAMPP Study
 - 2019 BRA Study
 - Basic model developed for current study
 - 2020 USACE FRM Study

Technical Support Data Notebook

DFIRM Update for Fort Bend County, Texas, Part 2

Task 42 – Hydrologic Analyses
Brazos River

Prepared by

Riverine Flood Insurance Studies Through out FEMA Region VI

Contract No. EMT-2002-CO-0049

Task Order 022

January 2009

MOFFATT & NICHOL CDM

Brazos River – HEC-HMS Model Updates and Calibration

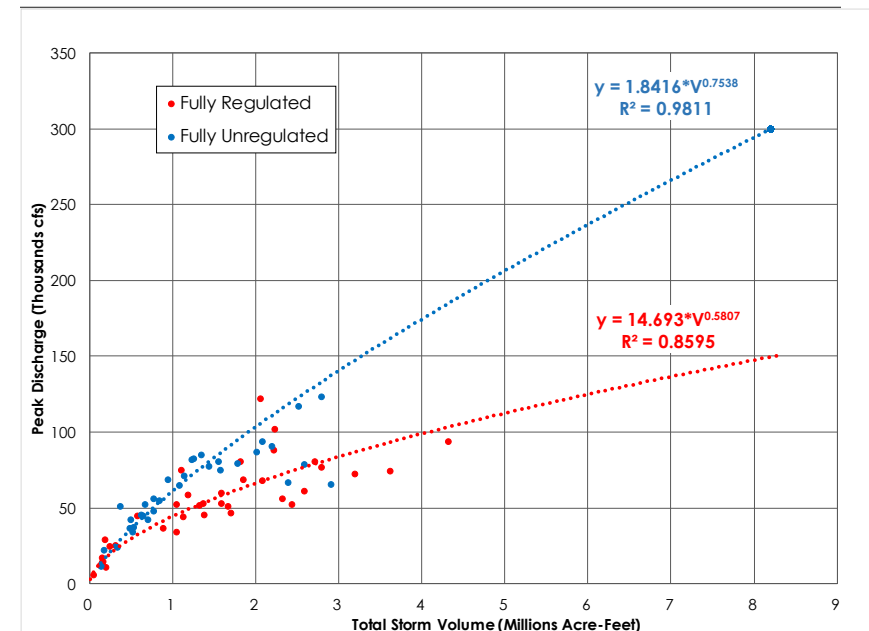

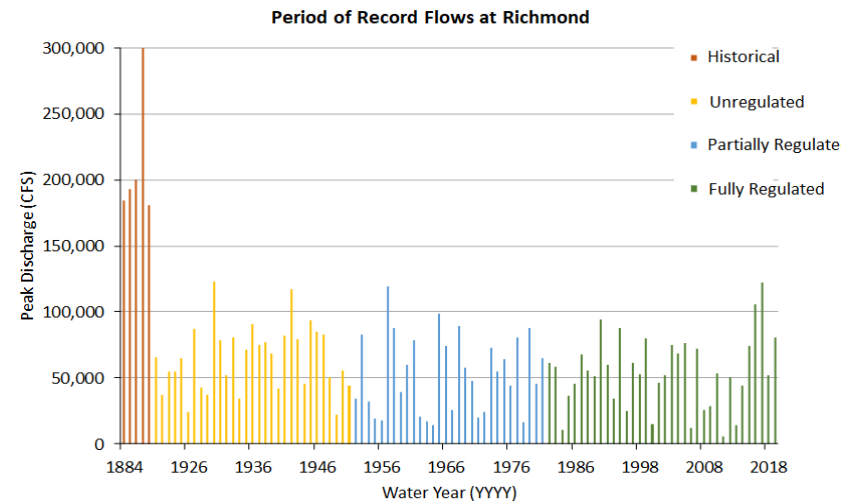

- Drainage Area Boundaries
- Unit Hydrograph Methods
- Losses based on 2016 and 2017
- Updated Routing
 - Brazos River from Bryan to Hempstead
 - Yegua Creek
 - Navasota River
- Calibration Events
 - Tax Day 2016
 - Memorial Day 2016
 - Hurricane Harvey 2017

Brazos River – Historical Gage Frequency Analysis

- Considered full period of record at Hempstead and Richmond
- Peak water year flows from USGS gage data
- Considered reservoir volumes
 - Unregulated (1951 and earlier)
 - Partial regulated (1982 to 1952)
 - Fully regulated (1953 and after)
- Calculated Flood Frequency Analysis

Conversion Process

Brazos River – Historical Gage Frequency Analysis

Full POR Results

Event	Unregulated Flows at Hempstead (CFS)	Unregulated Flows at Richmond (CFS)	Regulated Flows at Hempstead (CFS)	Regulated Flows at Richmond (CFS)
500-Year	325,000	310,000	193,000	156,000
100-Year	254,000	249,000	155,000	132,000
50-Year	223,000	221,000	138,000	120,000
10-Year	148,000	150,000	96,000	89,000
5-Year	115,000	117,000	77,000	74,000
2-Year	66,000	67,000	48,000	48,000

Gage Location	Regulated 100-Year, 5% CI (CFS)	Regulated 100-Year, 95% CI (CFS)
Hempstead	184,000	130,000
Richmond	152,000	112,000

**All results are preliminary and subject to further investigation.*

Brazos River – Historical Gage Frequency Analysis

FFA Scenarios

- Sensitivity analysis was conducted with FFA inputs

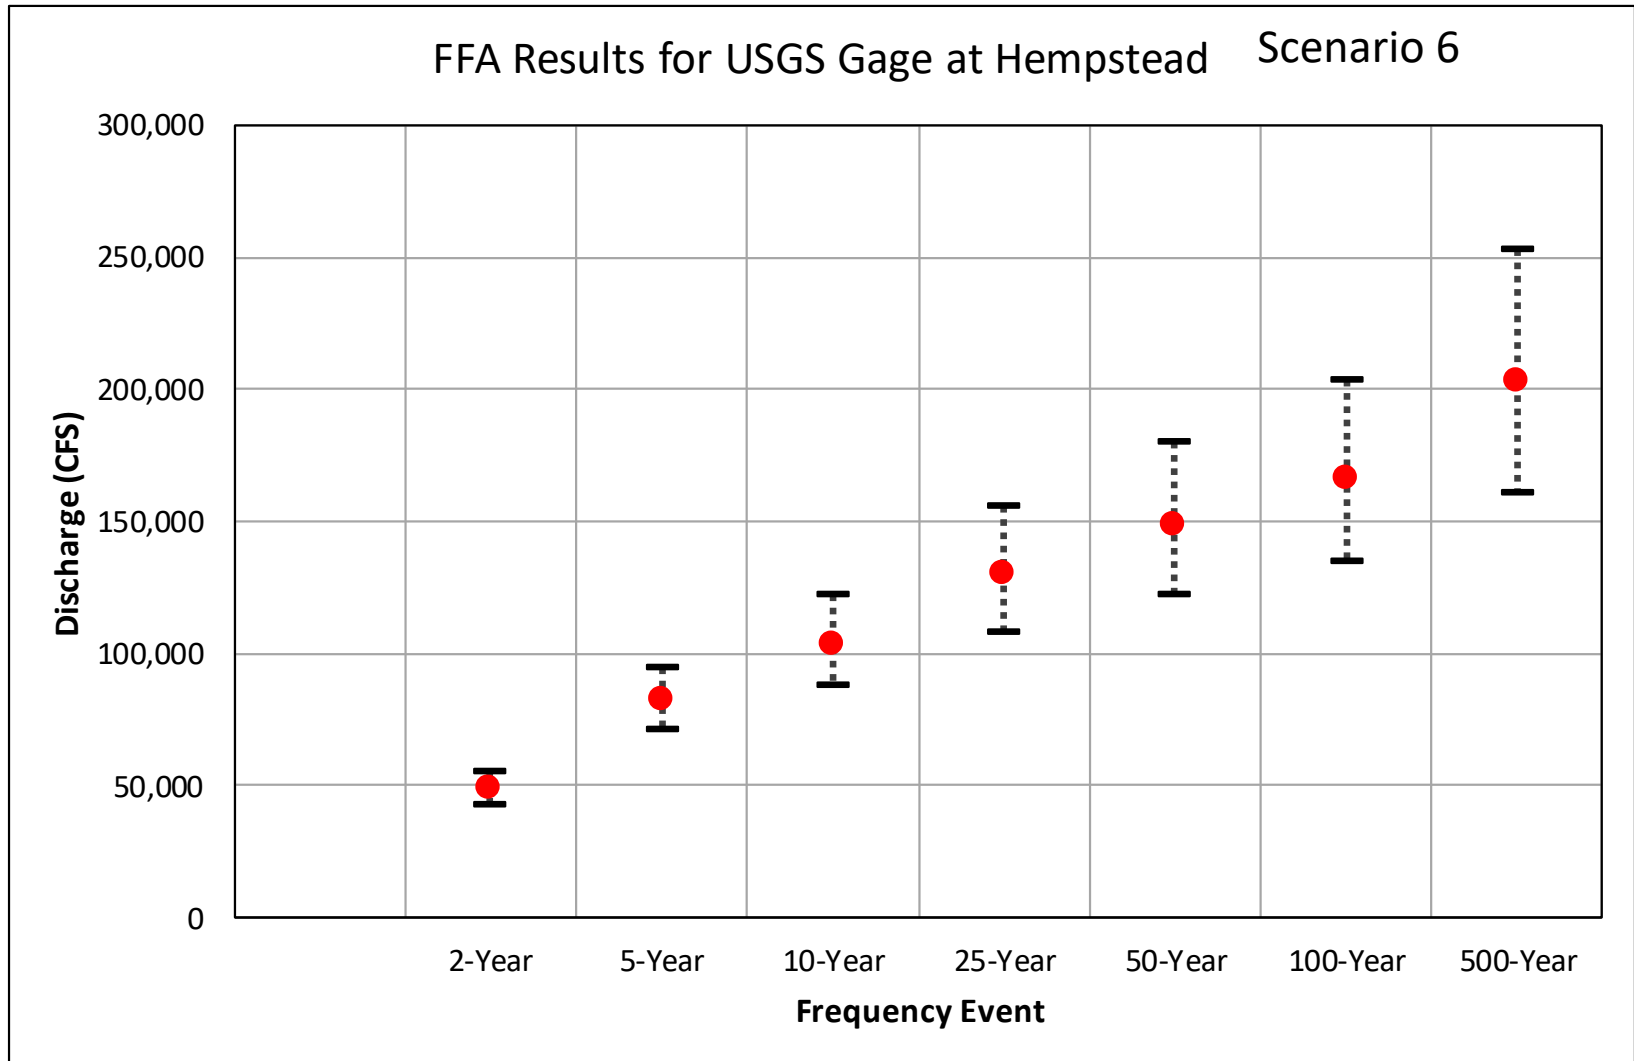

Name	Time	Conversion (unreg/reg) Used	Historic Events Used	Adjusted with 2D Model	FFA 1% Flow*	FFA 5% CI*	FFA 95% CI*
Current Study	POR	X	X		132,000	152,000	112,000
Scenario 1	Regulated				127,000	174,000	101,000
Scenario 2	POR	X			115,000	134,000	101,000
Scenario 3	POR	X	X	X	132,000	153,000	113,000
Scenario 4	POR				134,000	160,000	116,000
Scenario 5	Regulated			X	135,000	186,000	106,000
Scenario 6	POR			X	137,000	162,000	118,000

FFA results indicate that the 100-year flow is in the 130,000 – 140,000 cfs range. Effective flow is 164,000 cfs.

**All results are preliminary and subject to further investigation.*

Brazos River – Preliminary Conclusions

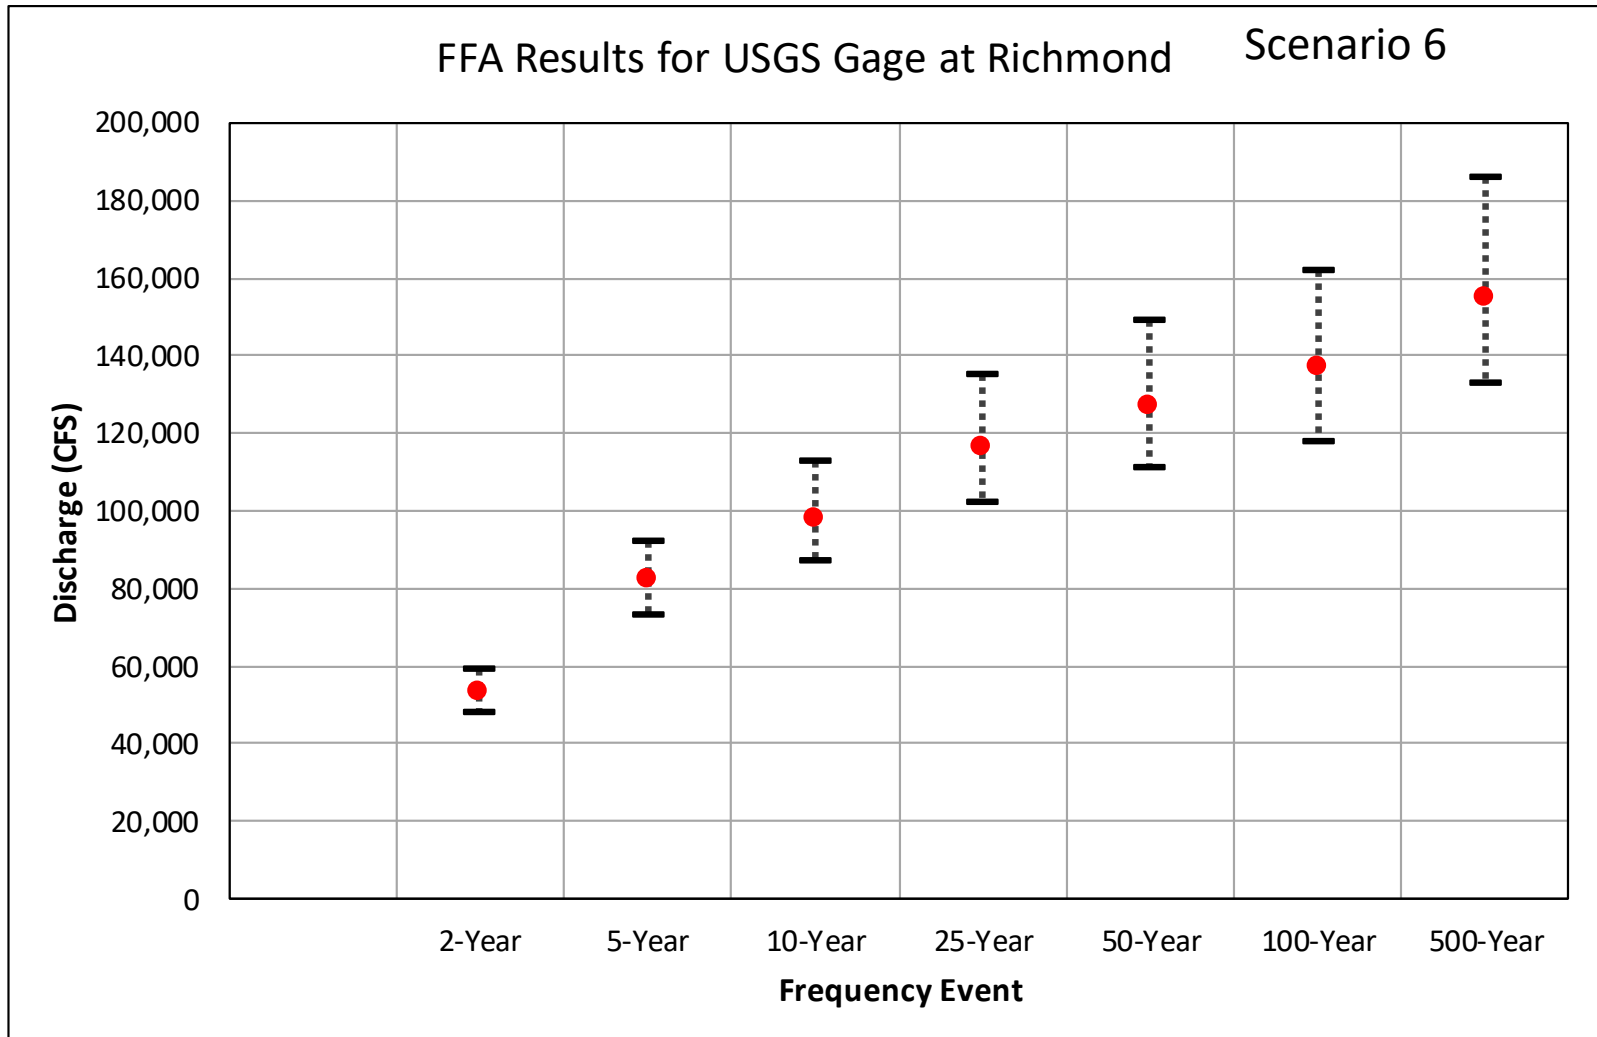

Hempstead

**All results are preliminary and subject to further investigation.*

Brazos River – Preliminary Conclusions

Richmond

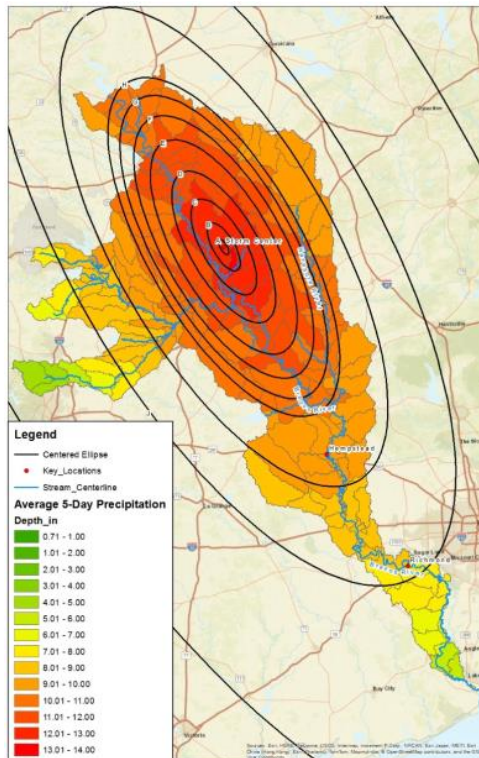

**All results are preliminary and subject to further investigation.*

Brazos River – Design Storm Modeling

Aerial Reduction Factors

- Reduction Factors
 - Areas up to 20,000 sq. mi. utilize USACE SWF Curve
 - Areas greater than 20,000 sq. mi. consider Harvey

Based on USACE SWF Curve

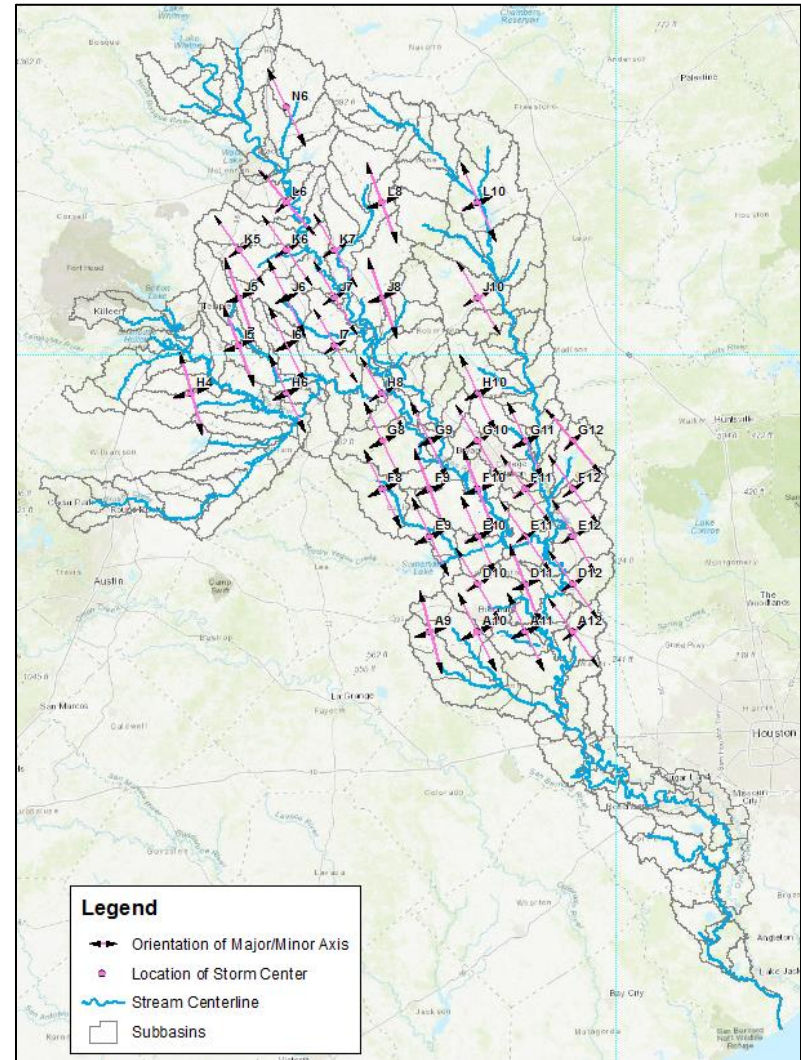

Based on Harvey Reduction Factors

Ellipse	Area of Ellipse (sq mi)	Areal Reduction Factors
A	10	1.00
B	100	0.96
C	400	0.92
D	1,000	0.85
E	2,000	0.82
F	3,000	0.80
G	4,000	0.77
H	5,000	0.74
I	10,000	0.68
J	20,000	0.51
K	60,000	0.17
L	100,000	0.09
M	200,000	0.03

Brazos River – Design Storm Modeling

Storm Centering

- Respective Atlas 14 rainfall depth applied at center of storm
 - Reduced by areal reduction curves as distance from center increases
- Storms placed on 20-mile grid
 - Basic orientation aligns with basin shape

Brazos River – Design Storm Modeling

Results - Hempstead

Hempstead

Questions on Hydrology?

Memorial Day 2016 at Big Creek Diversion

Hydraulics

Hydraulics – Previous Studies

- FEMA effective model
 - 2005 topography
 - 1D hydraulic model
 - Steady flow (snapshot in time)
 - Does not account for storage
- BRA Study
 - Completed in 2019
 - 1D hydraulic model
 - Unsteady flow (varies over time)
 - Calibrated to several storms, including Harvey
 - Better accounting of storage
 - Extents from HWY-290 to the Gulf
 - Used pre-Harvey field survey and LiDAR
 - Used effective model within Fort Bend County

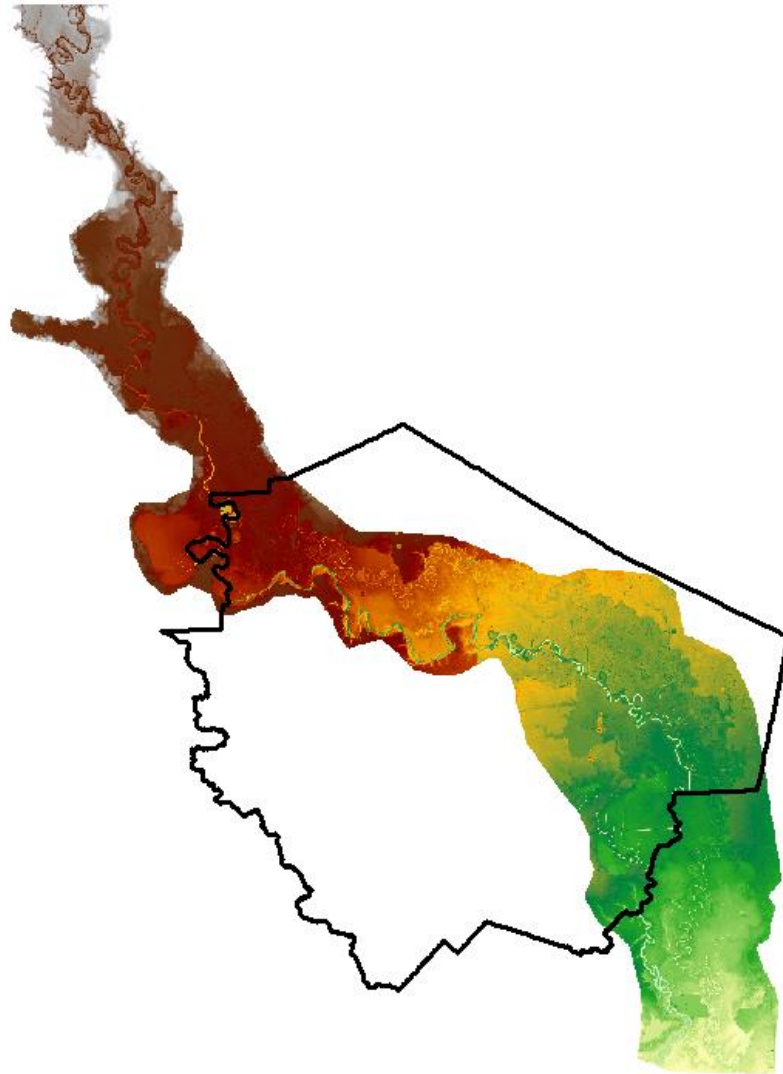

Hydraulics – Approach

- Current study
 - Best available topography + bathymetry
 - 2D hydraulic model
 - Unsteady flow (varies over time)
 - Best way of accounting for storage
 - Calibrated to Memorial Day 2016, Harvey, in-bank flows
 - Extents from HWY-290 to Harris Reservoir (Brazoria Co.)
 - 1D/2D hydraulic model in the works

Hydraulics – Topography

- Vertical Datum: NAVD88
- LiDAR
 - 2014 LiDAR for Fort Bend County
 - 2018 LiDAR for Brazoria County
 - Most current LiDAR for:
 - Waller
 - Austin
 - Washington
- Bathymetry & In-channel LiDAR
 - Collected by ERDC (USACE) in March 2019
- Survey from BRA study
 - Incorporated survey into terrain

Hydraulics – Topography

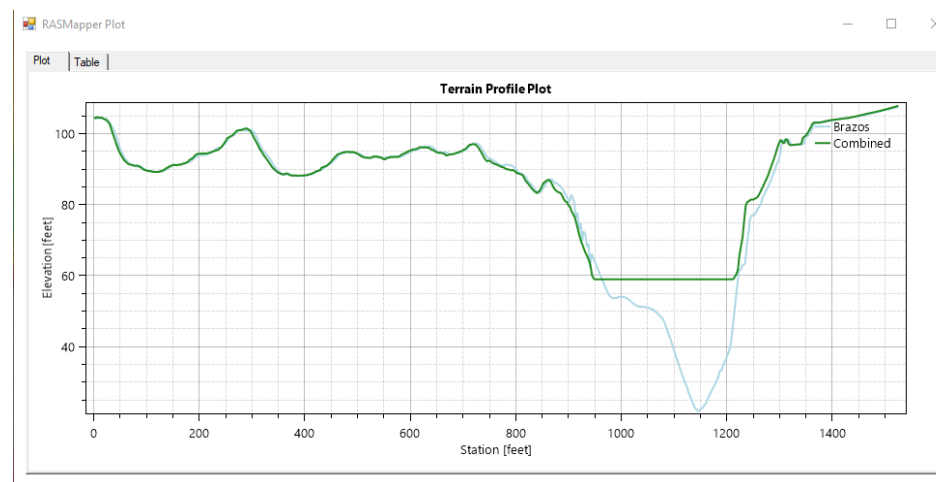

Hydraulics – Bathymetry (ERDC Survey)

LiDAR only

LiDAR + Bathymetry

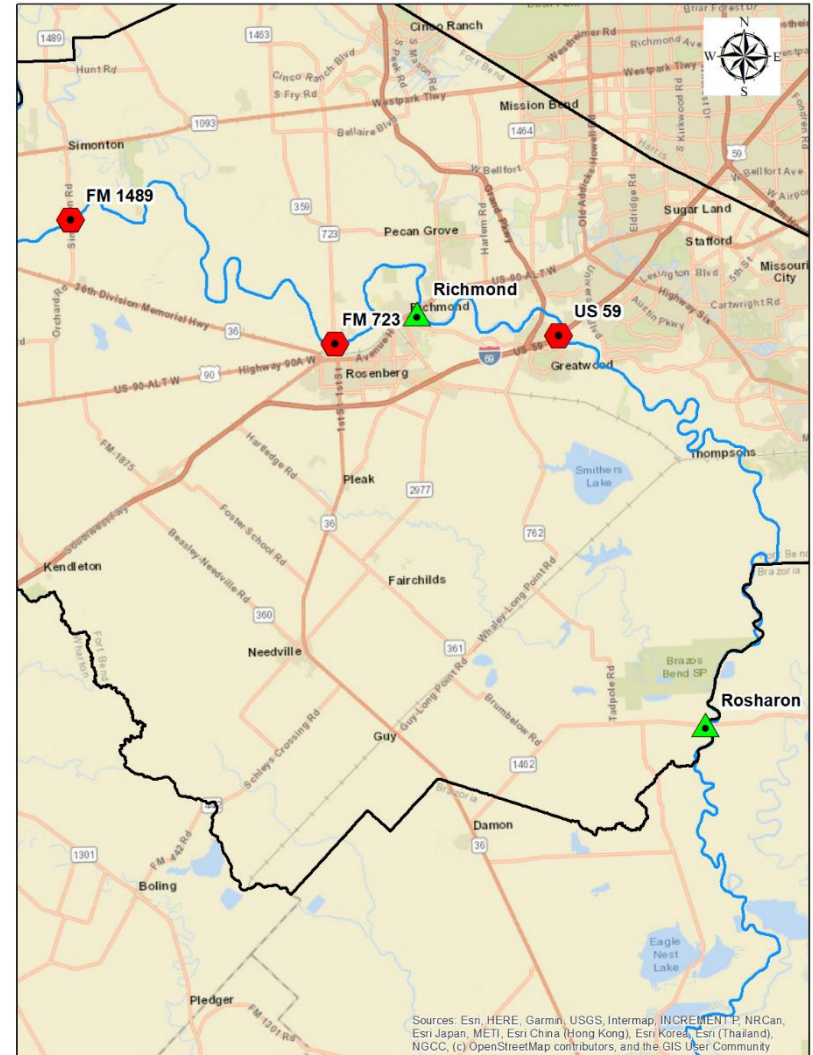

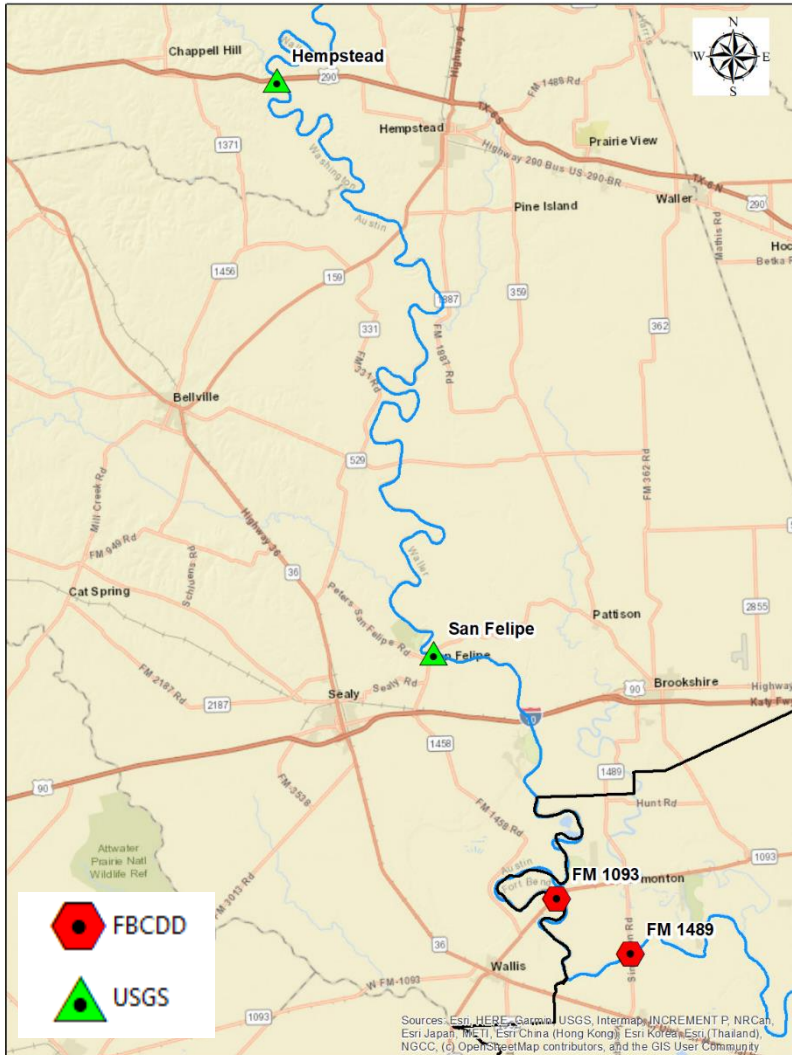

Hydraulics – Calibration

- Hydraulic Calibration
 - Memorial Day 2016
 - Harvey
 - Winter 18/19

- Calibrated to:
 - Stages at USGS gages
 - Hempstead
 - San Felipe
 - Richmond
 - Rosharon
 - FBCDD stages
 - FM 1093
 - FM 1489
 - FM 723
 - US 59

 - Used verified HWM as a check

Memorial Day 2016 at FM 723

Comparison of 100-yr elevations (PRELIMINARY)

DISCLAIMER

- Flows
 - Preliminary flows: Scenario 6
- Elevation datum
 - NAVD88 (Same as 2014 LiDAR)
- Topography
 - 2014 LiDAR
- Limitations (2D only)
 - Doesn't include bridges
- Results are subject to change

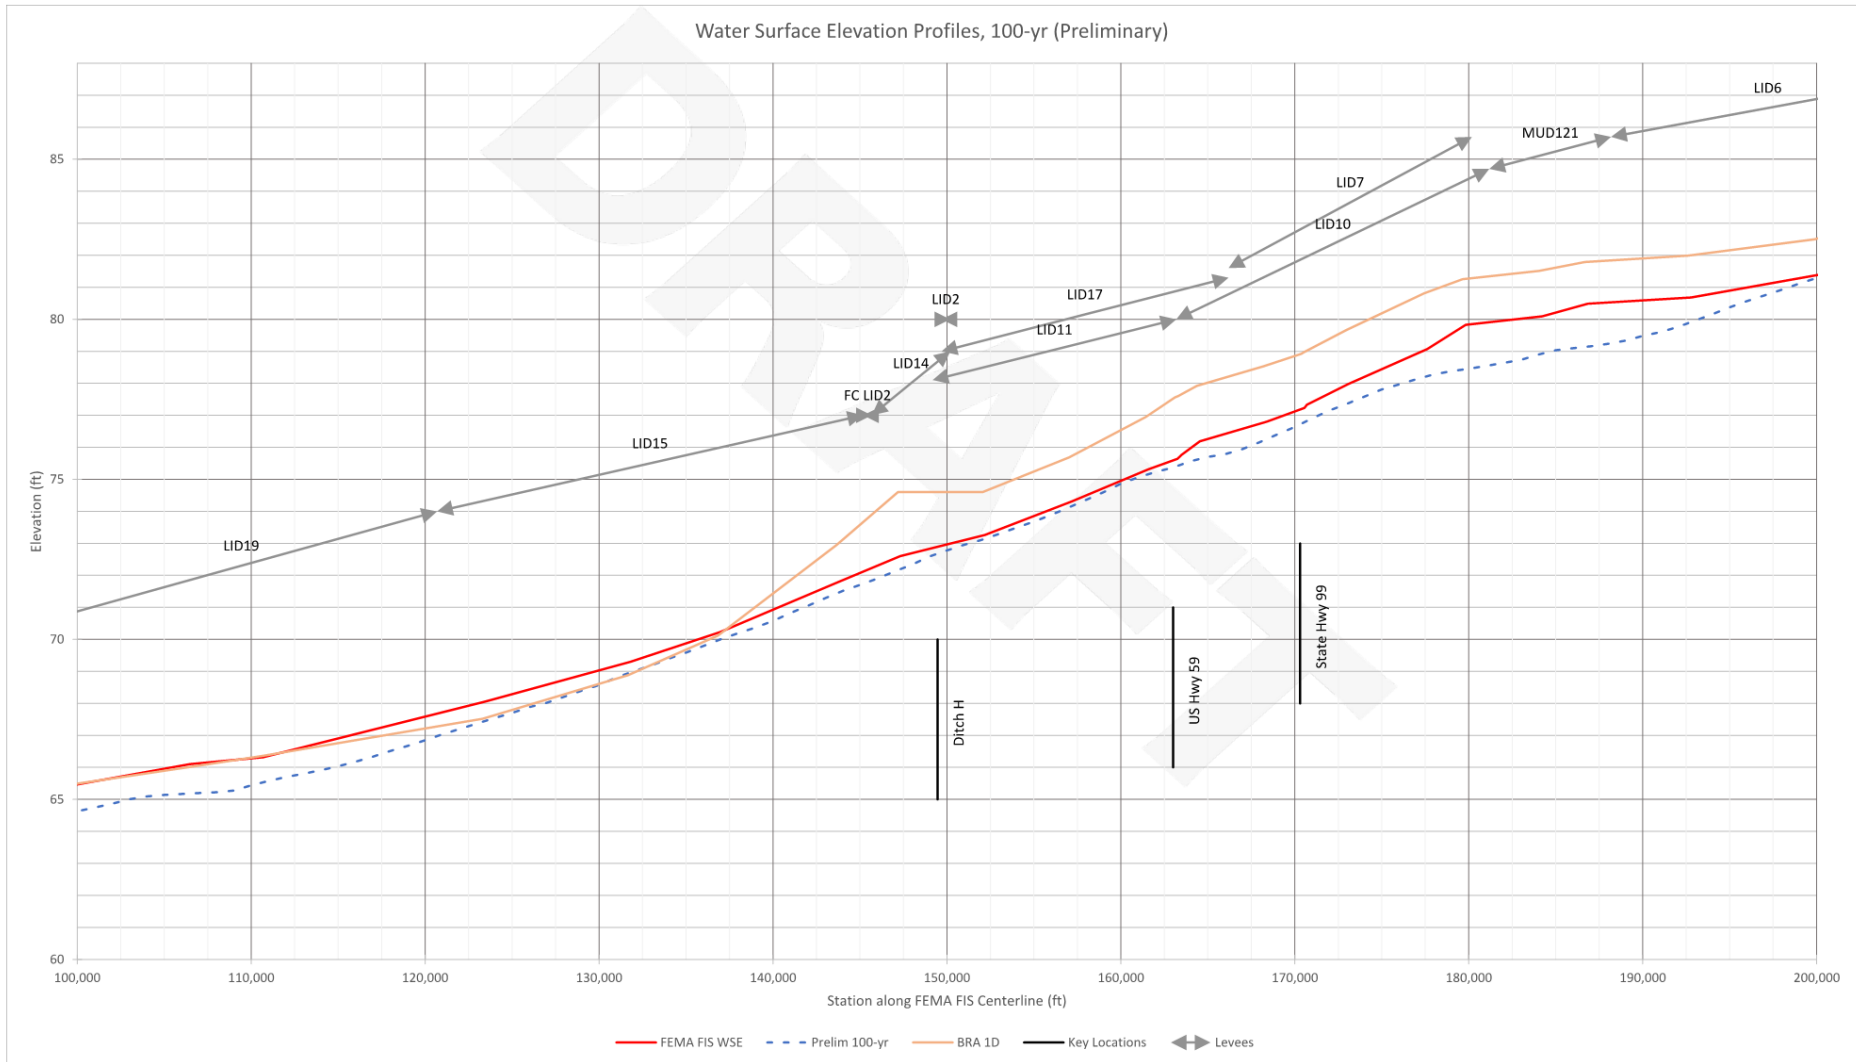

PRELIMINARY 100-YR WSEL

Gage	Effective	BRA Study	Preliminary
Richmond	82.80'	84.43'	83.03'
Rosharon	51.50'	51.29'	51.21'

PRELIMINARY 100-YR PROFILE

1D/2D Hydraulic Model

1D/2D Hydraulic Model

- Utilizes cross sections to represent river channel
- Utilizes 2D to represent overbanks (floodplain)
- Most accurate type of hydraulic model
- Includes bridges
- Oyster Creek, Bullhead Bayou, Ditch H, Brooks Lake Diversion
- Uses same topography as 2D model

- Model being calibrated

1D/2D Hydraulic Model

1D/2D Hydraulic Model

NEXT STEPS

- Finalize selection of flows and storm
- Finalize 1D/2D hydraulic model
- 2nd and final workshop (1D/2D results)
- Draft deliverables (models/report/profiles/maps)
 - Available for review in early Fall
- Final deliverables 4th quarter 2020

- Coordination with NWS
